doi:10.1038/nature09492

```
This file contains the parameter estimates of all
linear and non-linear models, fitted to each response
variable in turn. Only models that converged are shown.

The models are grouped by

 (i) response variable
(ii) type of model (both separated by dollar signs).

Models per type are numbered consecutively.

Abbreviated model types:

L.......Linear
M.......Michaelis-Menten models
E.......Exponential models
P.......Power models
AS......Self-starting asymptotic models
BIEXP...Self-starting biexponential models
LG......Self-starting logistic models

Models contained blocks (B1-B4), grass presence, legume presence
and number of plant functional groups in addition to the main
explanatory variable (sowndiv, plant species richness).

For a ranking of models, see Table S2.

####

$`Microbial biomass `$L01
Generalized least squares fit by maximum likelihood
  Model: response ~ block + (sowndiv + funcgr + grass + leg)^2
