Received January 18, 2002

From the ethyl acetate extract of the bacterial strain Cytophaga sp. AM13.1, among many known compounds, the new natural products 2,5-bis(3-indolylmethyl)pyrazine (2) and a highly symmetrical p-cyclophane named pharacine (5) were identified. In addition, tryptamine isovalerate (1) and p-hydroxyphenylacetamide (4), known as plant metabolites, were isolated and characterized from a microorganism for the first time. The new natural products showed no activity against three microalgae, the fungus Mucor miehei, the yeast Candida albicans, and the bacteria Staphylococcus aureus, Bacillus subtilis, Escherichia coli, and Streptomyces viridochromogenes.

Indole derivatives are common secondary metabolites from microorganisms, plants, and other sources. More than 1000 derivatives have been reported from microorganisms,2 most of them being substituted at C-3. In the course of a screening of microorganisms from the North Sea, a new indole derivative, 2,5-bis(3-indolylmethyl)pyrazine (2), and a natural p-cyclophane named pharacine (5) were isolated from the extracts of a Cytophaga strain AM13.1, and their structures were assigned spectroscopically. Additionally we report tryptamine isovalerate (madugin, 1)3 and p-hydroxyphenylacetamide (4)4 as secondary metabolites from a microorganism for the first time. The known compounds tryptamine acetate,3 2-phenylethylacetamide,5 3-indolylcarboxylic acid,6 7,8 cyclo(tyrolylprolyl),9 cyclo(phenylalanylprolyl),10 cyclo(valylprolyl),11 cyclo(isoucylylvalyl),12 2-(3-indolyl)ethanol,13 2-phenylethylisovaleramide,14 3-indolylactic acid,8,14 2,2-dimethylbenzopyrimid-4-one,15 o-aminonobenzamide,16 o-acetylanilinobenzamide (3),17 phenylacetamide,18 2-(p-hydroxyphenyl)ethanol,19 phenylacetic acid,20 3-phenyllactic acid,21 uracil, and thymidine were also found in the extracts. The dark yellow color of the colonies was due to tryptanthrin (6), a pigment known previously only from yeast.22

Results and Discussion

The 1H NMR spectrum of compound 1 from fraction 2 showed five aromatic proton signals between δ 7.0 and 7.6, four of which belonged to a 1,2-disubstituted benzene ring, and the last one, with a chemical shift of δ 7.04, was indicative for H-2 of an indole system. A triplet and a quartet at δ 2.98 and 3.62, respectively (the last one giving a triplet after D2O exchange), were typical for two methylene groups in vicinal position to each other. In addition, an isobutyl system was present due to signals at δ 2.10 (m, 1 H), 1.98 (d, 2 H), and 0.90 (d, 6 H).

The CI and EI mass spectra of compound 1 led to a molecular weight of 244. A search in AntiBase2 with the molecular weight and the substructures determined from the 1H NMR data resulted in the identification of compound 1 as tryptamine isovalerate (1), a compound already reported from the plant Clausena indica, which was confirmed by direct comparison of the NMR data.3

The 1H NMR spectrum of a second compound from fraction 2 showed five aromatic proton signals with a coupling pattern identical to that of 1, tryptamine acetate, and 2-(3-indolyl) ethanol: two doublets and two triplets of an ortho-disubstituted benzene ring and a doublet with a relatively small coupling constant, as typical of the pyrrole part of the indole ring. The indole skeleton was further supported by the pink color formation with Ehrlich’s reagent and the brown coloration with anisaldehyde/sulfuric acid.

Compound 2 showed an additional signal at deep field (δ 8.4) in the proton NMR spectrum. This suggested an electron-deficient heteroaromatic ring. In addition to the pattern of an indole skeleton, the 13C NMR spectrum contained signals of a methylene group at δ 30.8, and at δ 153.7 and 142.9 two aromatic carbons of which the first must be connected to nitrogen, as the formula contained no oxygen. The NMR data suggested the partial structure 1a (Figure 1).

The EIHRMS data of 2 led to the molecular formula C22H18N4, which contained double the number of carbon, nitrogen, and hydrogen atoms shown in the partial structure 1a. This suggested that the structure is a symmetrical dimer of 1a with the final structure 2.

Simple pyrazines are known as urinary signaling pheromones in the tree shrew (Tupaia belangeri) and the pine vole (Microtus pinetorum)23 or as pheromones of various ants.24 2,5-Dimethylpyrazine, 2-hydroxymethyl-5-methylpyrazine,15 and 2,5-dihydroxymethylpyrazine25 have been
The structure of the metabolite from fraction 3 was determined to be o-acetilaminobenzamide (3) by comparison of the spectral data with those of anthranilic acid, o-pyruvylaminobenzamide,29 and NI15501A.30 Comparison with data of 3 isolated previously from a terrestrial Streptomycete17 accompanied by the molecular formula (EIHRMS) confirmed the structure.

The high-resolution mass spectrum of compound 3 showed a molecular ion at m/z 151 and diagnostic signals at m/z 107 ([M – CONH2]+) and 44 ([CONH2]+). The mass and the fragmentation pattern were used to identify this compound as p-hydroxyphenyl acetamide (4). It has previously been reported from plants,31 and the structure was confirmed by direct comparison of the NMR data with reference values.31

The 1H NMR spectrum of compound 5 showed only three signals each of relative intensity 1. A singlet at δ 7.86 can be interpreted as the β-proton of a double bond conjugated with a carbonyl group or as an aromatic proton in conjunction with an electron-withdrawing substituent. Two broad singlets at δ 4.41 and 2.02 were observed, of which the first results from a group connected to oxygen. The 13C NMR spectrum displayed a CO signal of a carboxylic acid, ester, or amide at δ 165.5, two carbon signals at δ 133.9 (Cq) and 129.4 (CH), and two signals for methane carbons at δ 64.6 (OCH2) and 25.8 (CCH2C), corresponding to the proton signals mentioned above. The resonance of the sp2-carbons indicated that the molecule contained more likely a symmetrically substituted aromatic ring than a conjugated olefinic double bond. These few signals first pointed to a simple structure; however, the EI and CI mass spectra led to the molecular mass of 440 Da. The high resolution of the molecular ion delivered the formula C26H36O6, which suggested the structure to be highly symmetrical. The interpretation of 1D and 2D NMR spectra (COSY, HSQC, HMBC) led to the partial structure as in Figure 2. Here, the more plausible three-bond correlations have been drawn; however, two-bond correlations cannot be excluded completely due to identical shifts.

Terephthalic acid and several of its esters have been isolated from plants.2 Pharacine (5) is the first cyclic terephthalic acid ester from a natural source; however, it has already been described as a cyclization product from terephthaloyl chloride and butanediol34 or as trace components of poly(1,4-butylene terephthalate).35 To the best of our knowledge, NMR data have not been published; however, our mass spectra were nearly identical with those in the literature.36 As terephthalic esters are often used as additives in plastics, pharacine (5) could be present in the materials used in the laboratory and extracted as an artifact during the workup. We were able to reproduce the isolation from Cytophaga sp. AM13.1 strictly avoiding all contacts with plastic materials, yet we could not isolate it from other bacterial strains. To definitely rule out an artificial origin of 5, biosynthetic studies should be done, which are, however, presently not possible due to the very low yield.

The known metabolites tryptamine acetate,6 2-phenylethylacetamide,6 3-indolylcarboxylic acid,7 cycloyrosylproplyl,9 cyclophenylalaninopropyl,10 cyclovalypropyl,11 cyclo(eisoucylevaly),12 tryptantherin (6),22 2-(3-indoly)ethanol,13 2-phenylethlyisovaleramid,1 3-indolyacetic acid,8,14 2,2-dimethylbenzopyrid-4-one,15 o-aminobenzamide,16 phenylacetamide,18 2-(p-hydroxyphenyl)ethanol,19 phenylacetic acid,20 3-phenyllactic acid,21 uracil, and thymidime were also identified as constituents of Cytophaga sp. AM13.1 by NMR and MS data using AntiBase.2 While 6 contributes most to the antibacterial and antifungal activity of the crude extracts, the phenylethly amides are responsible for the weak phytotoxicity against the microalgae Chlorella vulgaris, Chlorella salina, and Scenedesmus subspicatus.3 Although also various biological activities were reported for the piperazinediones and most of the simple indole derivatives,4 we could not find any antibiotic or phytotoxic activity for 2 or 5.

The molecular formula suggested the molecule to consist of four equivalent parts resulting in structure 5, which we named pharacine. No other isomer is consistent with the chemical shifts and the long-range couplings. The structure was further confirmed by hydrolysis in methanol/2 N HCl followed by methylation with diazomethane, which delivered terephthalic acid dimethyl ester with a molecular ion at m/z 194. The broadened singlets (narrow multiplets after expansion) for the butanediol bridges may not correspond to the expectation; however, the data were identical with published values32 and very similar to simulated 13C and 1H NMR spectra,33 while other isomers such as the cyclic phenylenediacetic acid glycol ester were clearly different.

**Experimental Section**

**General Experimental Procedures.** NMR spectra were measured on a Varian Unity 300 (300.145 MHz) and a Varian Inova 500 (499.876 MHz) spectrometer in CDCl₃ with TMS as internal standard. CIMS was recorded on a Finnigan MAT 95 A instrument using NH₃ as reactant gas. EIMS was recorded on a Varian MAT 731 (70 eV), a Varian 311A (70 eV), and an AMD-402 (70 eV), and perfluorokerosene was used as reference substance in HREIMS. IR spectra were recorded on a Perkin-Elmer 1600 Series FTIR in KBr pellets. Preparative HPLC was performed using an RP18 column (Eurichrom Euroiser 1 100-5 300.145 MHz) and a Varian 311A (300.145 MHz) and a Varian 311A (100-300 MHz) with a linear acetonitrile-water azeotrope/water gradient (t = 0: 10% azeotrope, t = 25 min: 100% azeotrope; isocratic for a further 50 min). Flash chromatography was carried out on silica gel (30–60 m). 37 The sample was isolated from a 30 L water sample taken ca. 2 km offshore in the Helgoland Bight (54°08′N and 7°32′E) at a depth of 10 m using a Ruttner sampler. 37 The enriched sample was incubated at room temperature in the light for several days. Individual colonies were picked and subcultured. Sequence identity).

**Isolation of Cytophaga sp. Strain AM13.1.** Strain AM13.1 was isolated from a 30 L water sample taken ca. 2 km offshore the island of Helgoland, Germany (54° 08′ N and 7° 32′ E) at a depth of 10 m using a Ruttner sampler. 37 The sample was immediately filtered through a nylon mesh filter (pore size 5 m). The filtered water was stored at 4 °C in the dark for 1 year. An aliquot of 20 mL was amended with M13 medium (1 g Tryptone, 0.5 g Yeast extract, 50 mg Cycloheximide, 100 mg Ampicillin, 1 g NaCl) and by HPLC RP18 (MeCN/H₂O) delivered 12 mg of 2,5-bis(3-indolylmethyl)pyrazine (2 mg, tₚ = 15.57 min), 2 mg of tryptamine isovalerate (1 mg, tₚ = 21.17 min), and the known compounds cyclohexylcarboxylic acid (20 mg, tₚ = 14.10 min), cyclohexyl-carboxylic acid (4 mg, tₚ = 14.30 min), and cyclohexyl-carboxylic acid (2 mg, tₚ = 12.50 min), 2-(3-indolyloxy)ethanol (12 mg, tₚ = 16.10 min), 2-phenylethylacetamide (3 mg, tₚ = 16.80 min), tryptamine acetate (50 mg, tₚ = 19.70 min), tryptanthrin (6 mg, tₚ = 19.10 min), and cyclohexylcarboxylic acid (2 mg, tₚ = 20.20 min). 2-(p-Hydroxyphenyl)ethanol (5 mg, tₚ = 12.79 min), o-acetylaminobenzamide (3 mg, tₚ = 13.04 min), 3-indolyloxy-14.70 min), 2 mg of 2,2-dimethyl benzopyrimid-4-one (2 mg, tₚ = 15.01 min), p-phenylacetic acid (3 mg, tₚ = 18.01 min), o-aminobenzamide (50 mg, tₚ = 13.04 min), phenylethylacetamide (2 mg, tₚ = 20.80 min), and pharacine (5, 2 mg, tₚ = 24.50 min) were isolated from fraction 3 by column chromatography on Sephadex (3 × 60 cm, CHCl₃/MeOH 94:6). Fractions 4 and 5 gave p-hydroxyphenylacetamide (4, 3 mg, tₚ = 2.40 min), uracil (30 mg, tₚ = 3.67 min), thymidine (15 mg, tₚ = 5.02 min), and 3-phenylactic acid (3 mg, tₚ = 12.10 min).

**2,5-Bis(3-indolylmethyl)pyrazine (2):** Rₑ = 0.22 (CHCl₃/5% MeOH, Rₑ = 0.45 (CHCl₃/10% MeOH); IR (KBr) νmax 3267, 3057, 2921, 2856, 1612, 1489, 1457, 1429, 1344, 941 (C₅H₈N₄), 1232 (C₅H₈N₄), 1129 (C₅H₈N₄), 804 (C₅H₈N₄), 731 (C₅H₈N₄), 60 cm, 339 (11), 221 (9), 154 (4), 130 (68), 83 (8), CI-MS (NH₄) m/z 356 [M + NH₄]⁺ (3), 339 [M + H+]⁺ (100); HREIMS m/z 338.1520 (calcld for C₂₅H₂₁N₄O, 338.1531).

**Pharacine (5):** Rₑ = 0.90 (CHCl₃/5% MeOH); IR (KBr) νmax 2962, 2928, 2962, 1721, 1635, 1383, 1280, 1124, 1014, 946, 874, 729 cm⁻¹; ¹H NMR (CDCl₃, 300 MHz) δ 7.86 (H, s, ar-H), 4.41 (H, s, br, 4 OCH₂), 2.02 (H, s, br, 4 CH₂); ¹C NMR (CDCl₃, 125.7 MHz) δ 165.5 (CO), 133.9 (C₄), 129.4 (CH), 64.6 (OCH₂), 25.8 (CH₃); EI-MS (70 eV) m/z 440 (M⁺) (73), 369 (100), 324 (20), 176 (20), 149 (63), 137 (89), 104 (37), 54 (87); CI-MS (NH₄) m/z 898 [2M + NH₄]⁺ (11), 458 [M + NH₄]⁺ (100); EI/HRMS 440.1468 (calcld for C₂₅H₂₁N₄O, 440.1472).

**Biological Tests.** All tests were performed using the agar diffusion method with bacteria, fungi, or microalgae as test organisms, as described previously. ¹³⁹

**Figure 3.** Workup scheme for the strain Cytophaga sp. AM13.1. 0.5 L of CHCl₃/20% MeOH, 0.5 L of CHCl₃/50% MeOH) to deliver five fractions (Figure 3).

Further purification of fraction 2 on Sephadex (3 × 60 cm, MeCN/H₂O 94:6) delivered 12 mg of 2,5-bis(3-indolylmethyl)pyrazine (2 mg, tₚ = 15.01 min), 2 mg of tryptamine isovalerate (1 mg, tₚ = 21.17 min), and the known compounds cyclohexylcarboxylic acid (20 mg, tₚ = 14.10 min), cyclohexyl-carboxylic acid (4 mg, tₚ = 14.30 min), and cyclohexyl-carboxylic acid (2 mg, tₚ = 12.50 min), 2-(3-indolyloxy)ethanol (12 mg, tₚ = 16.10 min), 2-phenylethylacetamide (3 mg, tₚ = 16.80 min), tryptamine acetate (50 mg, tₚ = 19.70 min), tryptanthrin (6 mg, tₚ = 19.10 min), and cyclohexylcarboxylic acid (2 mg, tₚ = 20.20 min). 2-(p-Hydroxyphenyl)ethanol (5 mg, tₚ = 12.79 min), o-acetylaminobenzamide (3 mg, tₚ = 13.04 min), 3-indolyloxy-14.70 min), 2 mg of 2,2-dimethyl benzopyrimid-4-one (2 mg, tₚ = 15.01 min), p-phenylacetic acid (3 mg, tₚ = 18.01 min), o-aminobenzamide (50 mg, tₚ = 13.04 min), phenylethylacetamide (2 mg, tₚ = 20.80 min), and pharacine (5, 2 mg, tₚ = 24.50 min) were isolated from fraction 3 by column chromatography on Sephadex (3 × 60 cm, CHCl₃/MeOH 94:6). Fractions 4 and 5 gave p-hydroxyphenylacetamide (4, 3 mg, tₚ = 2.40 min), uracil (30 mg, tₚ = 3.67 min), thymidine (15 mg, tₚ = 5.02 min), and 3-phenylactic acid (3 mg, tₚ = 12.10 min).
Acknowledgment. We would like to thank Mrs. F. Lissy and Mr. D. Fechner for technical assistance, and Dr. I. A. van Altena (Vancouver) for a careful revision of the manuscript. R.P.M. and M.S. thank the DAAD for financial support. This work was financed by a grant from the Volkswagenstiftung (Land Niedersachsen) within the Lower Saxony Cooperative Research Project of Marine Biotechnology.
