NAG C Library Function Document

nag_mesh2d_bound (d06bac)

1 Purpose

nag_mesh2d_bound (d06bac) generates a boundary mesh on a closed connected subdomain $\Omega$ of $\mathbb{R}^2$.

2 Specification

```c
void nag_mesh2d_bound (Integer nlines, const double coorch[], const Integer lined[],
                      double (*fbnd)(Integer i, double x, double y, Nag_Comm *comm),
                      const double coorus[], Integer nus, const double rate[], Integer ncomp,
                      const Integer ncomp[], const Integer lcomp[], Integer nvmax, Integer nedmx,
                      Integer *nvb, double coor[], Integer *nedge, Integer edge[], Integer itrace,
                      const char *outfile, Nag_Comm *comm, NagError *fail)
```

3 Description

Given a closed connected subdomain $\Omega$ of $\mathbb{R}^2$, whose boundary $\partial\Omega$ is divided by characteristic points into $m$ distinct line segments, nag_mesh2d_bound (d06bac) generates a boundary mesh on $\partial\Omega$. Each line segment may be a straight line, a curve defined by the equation $f(x, y) = 0$, or a polygonal curve defined by a set of given boundary mesh points.

This function is primarily designed for use either with nag_mesh2d_inc (d06aac) (a simple incremental method) or nag_mesh2d_delaunay (d06abc) (Delaunay–Voronoi method) or nag_mesh2d_front (d06acc) (Advancing Front method) to triangulate the interior of the domain $\Omega$. For more details about the boundary and interior mesh generation, consult the d06 Chapter Introduction as well as George and Borouchaki (1998).

This function is derived from material in the MODULEF package from INRIA (Institut National de Recherche en Informatique et Automatique).

4 References

5 Parameters

1:  
   nlines – Integer  

   On entry: $m$, the number of lines that define the boundary of the closed connected subdomain (this equals the number of characteristic points which separate the entire boundary $\partial\Omega$ into lines).  

   Constraint: $\text{nlines} \geq 1$.

2:  
   coorch[2 x nlines] – const double  

   Note: where $\text{COORCH}(i, j)$ appears in this document it refers to the array element $\text{coorch}[2 \times (j - 1) + i - 1]$. We recommend using a #define to make the same definition in your calling program.  

   On entry: $\text{COORCH}(1, i)$ contains the $x$-coordinate of the $i$th characteristic point, for $i = 1, \ldots, \text{nlines}$, while $\text{COORCH}(2, i)$ contains the corresponding $y$-coordinate.
3: \( \text{lined}[4 \times \text{nlines}] = \text{const Integer} \)  

Note: where \( \text{LINED}(i, j) \) appears in this document it refers to the array element \( \text{lined}[4 \times (j - 1) + i - 1] \). We recommend using a \#define to make the same definition in your calling program.

On entry: the description of the lines that define the boundary domain. The line \( i \), for \( i = 1, \ldots, m \), is defined as follows:

(a) \( \text{LINED}(1, i) \): the number of points on the line, including two end-points.

(b) \( \text{LINED}(2, i) \): the first end-point of the line. If \( \text{LINED}(2, i) = j \), then the coordinates of the first end-point are those stored in \( \text{COORCH}(j, \cdot) \).

(c) \( \text{LINED}(3, i) \): the second end-point of the line. If \( \text{LINED}(3, i) = k \), then the coordinates of the second end-point are those stored in \( \text{COORCH}(\cdot, k) \).

(d) \( \text{LINED}(4, i) \): this defines the type of line segment connecting the end-points. Additional information is conveyed by the numerical value of \( \text{LINED}(4, i) \) as follows:

(i) \( \text{LINED}(4, i) > 0 \), the line is described in the user-supplied function \( \text{fbnd} \) with \( \text{LINED}(4, i) \) as the index. In this case, the line must be described in the trigonometric (anticlockwise) direction;

(ii) \( \text{LINED}(4, i) = 0 \), the line is a straight line;

(iii) if \( \text{LINED}(4, i) < 0 \), say \( -p \), then the line is a polygonal arc joining the end-points and interior points specified in \( \text{COORUS} \). In this case the line contains the points whose coordinates are stored in \( \text{COORCH}(\cdot, j), \text{COORUS}(\cdot, p), \text{COORUS}(\cdot, p + 1), \ldots \), \( \text{COORUS}(\cdot, p + r - 3) \), \( \text{COORCH}(\cdot, k) \), where \( r = \text{LINED}(1, i), j = \text{LINED}(2, i) \) and \( k = \text{LINED}(3, i) \).

Constraints:

\[
\begin{align*}
2 & \leq \text{LINED}(1, i); \\
1 & \leq \text{LINED}(2, i) \leq \text{nlines}; \\
1 & \leq \text{LINED}(3, i) \leq \text{nlines}; \\
\text{LINED}(2, i) & \neq \text{LINED}(3, i) \text{ for } i = 1, 2, \ldots, \text{nlines}.
\end{align*}
\]

For each line described by the user-supplied function (lines with \( \text{LINED}(4, i) > 0 \), \( i = 1, \ldots, \text{nlines} \)) the two end-points (\( \text{LINED}(2, i) \) and \( \text{LINED}(3, i) \)) lie on the curve defined by index \( \text{LINED}(4, i) \) in the user-supplied function \( \text{fbnd} \), i.e.,

\[
\begin{align*}
\text{fbnd}(\text{LINED}(4, i), \text{coorh}(1, \text{LINED}(2, i)), \text{coorh}(2, \text{LINED}(2, i)), \text{comm}) &= 0; \\
\text{fbnd}(\text{LINED}(4, i), \text{coorh}(1, \text{LINED}(3, i)), \text{coorh}(2, \text{LINED}(3, i)), \text{comm}) &= 0 \quad \text{for } i = 1, 2, \ldots, \text{nlines}.
\end{align*}
\]

For all lines described as polygonal arcs (lines with \( \text{LINED}(4, i) < 0 \), \( i = 1, \ldots, \text{nlines} \)) the sets of intermediate points (i.e. \( [-\text{LINED}(4, i) : -\text{LINED}(4, i) + \text{LINED}(1, i) - 3] \) for all \( i \) such that \( \text{LINED}(4, i) < 0 \) are not overlapping. This can be expressed as:

\[
-\text{LINED}(4, i) + \text{LINED}(1, i) - 3 = \sum_{i : \text{LINED}(4, i) < 0} \{ \text{LINED}(1, i) - 2 \}
\]

or

\[
-\text{LINED}(4, i) + \text{LINED}(1, i) - 2 = -\text{LINED}(4, j),
\]

for a \( j \) such that \( j = 1, \ldots, \text{nlines}, j \neq i \) and \( \text{LINED}(4, j) < 0 \).

4: \( \text{fbnd} \)  

Function

This function must be supplied by the user to calculate the value of the function which describes the curve \( \{ (x, y) \in \mathbb{R}^2 : \text{such that } f(x, y) = 0 \} \) on segments of the boundary for which \( \text{LINED}(4, i) > 0 \). If there are no boundaries for which \( \text{LINED}(4, i) > 0 \) \( \text{fbnd} \) will never be referenced by \( \text{nag_mesh2d_bound} \) (d06bac) and \( \text{fbnd} \) may be null.

Its specification is:
double fbnd (Integer i, double x, double y, Nag_Comm *comm)

1: i – Integer
   *Input*
   *On entry:* \( \text{LINED}(4, i) \), the reference index of the line (portion of the contour) \( i \) described.

2: x – double
   *Input*

3: y – double
   *Input*
   *On entry:* the values of \( x \) and \( y \) at which \( f(x, y) \) is to be evaluated.

4: comm – NAG_Comm *
   *Input/Output*
   The NAG communication parameter (see the Essential Introduction).

5: coorus[2 × nus] – const double
   *Input*
   *Note:* where \( \text{COORUS}(i, j) \) appears in this document it refers to the array element \( \text{coorus}[2 \times (j - 1) + i - 1] \). We recommend using a #define to make the same definition in your calling program.
   *On entry:* the coordinates of the intermediate points for polygonal arc lines. For a line \( i \) defined as a polygonal arc (i.e., \( \text{LINED}(4, i) < 0 \)), if \( p = \text{LINED}(4, i) \), then \( \text{COORUS}(1, k), k = p, p + 1, \ldots, p + \text{LINED}(1, i) - 3 \) must contain the \( x \)-coordinate of the consecutive intermediate points for this line. Similarly \( \text{COORUS}(2, k), k = p, p + 1, \ldots, p + \text{LINED}(1, i) - 3 \) must contain the corresponding \( y \)-coordinate.

6: nus – Integer
   *Input*
   *On entry:* the second dimension of the array \( \text{coorus} \) as declared in the function from which \( \text{nag_mesh2d_bound} \) (d06bac) is called.
   *Constraint:* \( nus \geq \sum_{\{i: \text{LINED}(4, i) < 0\}} \{\text{LINED}(1, i) - 2\} \).

7: rate[nlines] – const double
   *Input*
   *On entry:* \( \text{rate}[i - 1] \) is the geometric progression ratio between the points to be generated on the line \( i \), for \( i = 1, \ldots, m \) and \( \text{LINED}(4, i) \geq 0 \). \( \text{rate}[i - 1] \) is not referenced if \( \text{LINED}(4, i) < 0 \).
   *Constraint:*
   if \( \text{LINED}(4, i) \geq 0 \), \( \text{rate}[i - 1] > 0 \) for \( i = 1, 2, \ldots, \text{nlines} \).

8: ncomp – Integer
   *Input*
   *On entry:* \( n \), the number of separately connected components of the boundary.
   *Constraint:* \( ncomp \geq 1 \).

9: nlcomp[ncomp] – const Integer
   *Input*
   *On entry:* \( \text{nlcomp}[k - 1] \) is the number of line segments in component \( k \) of the contour. The line \( i \) of component \( k \) runs in the direction \( \text{LINED}(2, i) \) to \( \text{LINED}(3, i) \) if \( \text{nlcomp}[k - 1] > 0 \), and in the opposite direction otherwise; for \( k = 1, \ldots, n \).
   *Constraints:*
   \[ 1 \leq |\text{nlcomp}[k - 1]| \leq \text{nlines} \text{ for } k = 1, 2, \ldots, \text{ncomp}; \]
   \[ \sum_{k=1}^{n} |\text{nlcomp}[k - 1]| = \text{nlines}. \]
10: \( \text{lcomp}[\text{nlines}] \) – const Integer  
\text{Input}  
\text{On entry: } \text{lcomp}[l1 - 1:l2 - 1], \text{ where } l2 = \sum_{i=1}^{k} \text{lcomp}[i - 1] \text{ and } l1 = l2 + 1 - |\text{lcomp}[k - 1]| \text{ is the list of line numbers for the } k\text{th components of the boundary, for } k = 1, \ldots, \text{ncomp}.  
\text{Constraint:} \text{lcomp} \text{ must hold a valid permutation of the integers } [1, \text{nlines}].  

11: \( \text{nvmax} \) – Integer  
\text{Input}  
\text{On entry:} \text{ the maximum number of the boundary mesh vertices to be generated.}  
\text{Constraint:} \text{nvmax} \geq \text{nlines}.  

12: \( \text{nedmx} \) – Integer  
\text{Input}  
\text{On entry:} \text{ the maximum number of boundary edges in the boundary mesh to be generated.}  
\text{Constraint:} \text{nedmx} \geq 1.  

13: \( \text{nvb} \) – Integer *  
\text{Output}  
\text{On exit:} \text{ the total number of boundary mesh vertices generated.}  

14: \( \text{coor}[2 \times \text{nvmax}] \) – double  
\text{Output}  
\text{Note:} \text{ where COOR}(i, j) \text{ appears in this document it refers to the array element } \text{coor}[2 \times (j - 1) + i - 1]. \text{ We recommend using a \#define to make the same definition in your calling program.}  
\text{On exit:} \text{ COOR}(1,i) \text{ will contain the } x\text{-coordinate of the } i\text{th boundary mesh vertex generated, for } i = 1, \ldots, \text{nvb}; \text{ while COOR}(2,i) \text{ will contain the corresponding } y\text{-coordinate.}  

15: \( \text{edge}[3 \times \text{nedmx}] \) – Integer *  
\text{Output}  
\text{On exit:} \text{ the total number of boundary edges in the boundary mesh.}  
\text{Note:} \text{ where EDGE}(i, j) \text{ appears in this document it refers to the array element } \text{edge}[3 \times (j - 1) + i - 1]. \text{ We recommend using a \#define to make the same definition in your calling program.}  
\text{On exit:} \text{ the specification of the boundary edges.} \text{ EDGE}(1,j) \text{ and EDGE}(2,j) \text{ will contain the vertex numbers of the two end-points of the } j\text{th boundary edge.} \text{ EDGE}(3,j) \text{ is a reference number for the } j\text{th boundary edge and}  
\text{EDGE}(3,j) = \text{LINED}(4,i), \text{ where } i \text{ and } j \text{ are such that the } j\text{th edges is part of the } i\text{th line of the boundary and LINED}(4,i) \geq 0;  
\text{EDGE}(3,j) = 100 + |\text{LINED}(4,i)|, \text{ where } i \text{ and } j \text{ are such that the } j\text{th edges is part of the } i\text{th line of the boundary and LINED}(4,i) < 0.  
\text{Note that the edge vertices are numbered from 1 to } \text{nvb}.  

17: \( \text{itrace} \) – Integer  
\text{Input}  
\text{On entry:} \text{ the level of trace information required from nag_mesh2d_bound (d06bac) as follows:}  
\text{if} \text{itrace} \leq 0, \text{ no output is generated.}  
\text{if} \text{itrace} = 1, \text{ then output from the boundary mesh generator is printed. This output contains}  
\text{the input informations of each line and each connected component of the boundary.}  
\text{if} \text{itrace} > 1, \text{ then the output is similar to that produced when } \text{itrace} = 1, \text{ but the coordinates}  
\text{of the generated vertices on the boundary are also output.}  
\text{if} \text{itrace} = -1, \text{ then an analysis of the output boundary mesh is printed on the current}  
\text{advisory message unit. This analysis includes the orientation (clockwise or anticlockwise) of}
each connected component of the boundary. Those informations could be of interest to the
user, especially if an interior meshing is carried out using the output of this function, calling
either nag_mesh2d_inc (d06aac), nag_mesh2d_delaunay (d06abc) or nag_mesh2d_front
(d06acc).

Users are advised to set itrace = 0, unless they are experienced with Finite Element meshes
generation.

18:  outfile – char *
    Input
    On entry: the name of a file to which diagnostic output will be directed. If outfile is NULL the
diagnostic output will be directed to standard output.

19:  comm – NAG_Comm *
    Input/Output
    The NAG communication parameter (see the Essential Introduction).

20:  fail – NagError *
    Input/Output
    The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

NE_INT
    On entry, ncomp the number of connected components of the boundary is less than 1:
    ncomp = ⟨value⟩.

    On entry, nedmx the maximum number of boundary edge lines is less than 1: nedmx = ⟨value⟩.

    On entry, nlines the number of lines is less than 1: nlines = ⟨value⟩.

NE_INT_2
    On entry, the sum of absolute values of all numbers of line segments is different from nlines The
    sum of all the elements of nlcomp = ⟨value⟩, nlines = ⟨value⟩.

    On entry, nvmax the maximum number of boundary vertices is less than nlines: nvmax = ⟨value⟩,
    nlines = ⟨value⟩.

    On entry, the line list for the separate connected component of the boundary is badly set: lcomp[l − 1] = ⟨value⟩, l = ⟨value⟩. It should be less than or equal to nlines and greater than or
equal to 1.

    On entry, nus < nusmin: nus = ⟨value⟩, nusmin = ⟨value⟩.

    On entry, there is a correlation problem between the user-supplied coordinates and the specification
    of the polygonal arc representing line i = ⟨value⟩ with the index in coorus = ⟨value⟩.

    On entry, the number of points on line ⟨value⟩ is ⟨value⟩. It should be greater than or equal to 2.

NE_INT_3
    On entry, the indices of the extremities of line ⟨value⟩ are both equal to ⟨value⟩.

    On entry, the index of the second end-point of line ⟨value⟩ is ⟨value⟩. It should be greater than or
equal to 1 and less than or equal to nlines = ⟨value⟩.

    On entry, the index of the first end-point of line ⟨value⟩ is ⟨value⟩. It should be greater than or equal
to 1 and less than or equal to nlines = ⟨value⟩.

    On entry, the absolute number of line segments in the kth component of the contour should be less
than or equal to nlines and greater than 0. k = ⟨value⟩, nlcomp[k − 1] = ⟨value⟩, nlines = ⟨value⟩.
On entry, there is a problem with either the coordinates of characteristic points, or with the definition of the mesh lines.

On entry, end-point 1, with index \( k \), does not lie on the curve representing line \( i \) with index \( j \):
\[ k = \langle \text{value} \rangle, \quad i = \langle \text{value} \rangle, \quad j = \langle \text{value} \rangle, \quad f(x,y) = \langle \text{value} \rangle. \]

On entry, end-point 2, with index \( k \), does not lie on the curve representing line \( i \) with index \( j \):
\[ k = \langle \text{value} \rangle, \quad i = \langle \text{value} \rangle, \quad j = \langle \text{value} \rangle, \quad f(x,y) = \langle \text{value} \rangle. \]

On entry, the geometric progression ratio between the points to be generated on line \( \langle \text{value} \rangle \) is \( \langle \text{value} \rangle \). It should be greater than 0 unless the line segment is defined by user-supplied points.

An error has occurred during the generation of the boundary mesh. It appears that \( \text{nvmax} \) is not large enough: \( \text{nvmax} = \langle \text{value} \rangle \).

An error has occurred during the generation of the boundary mesh. It appears that \( \text{nedmx} \) is not large enough: \( \text{nedmx} = \langle \text{value} \rangle \).

Memory allocation failed.

On entry, parameter \( \langle \text{value} \rangle \) had an illegal value.

Cannot open file \( \langle \text{value} \rangle \) for writing.

Cannot close file \( \langle \text{value} \rangle \).

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

Not applicable.

The boundary mesh generation technique in this function has a ‘tree’ structure. The boundary should be partitioned into geometrically simple segments (straight lines or curves) delimited by characteristic points. Then, the lines should be assembled into connected component of the boundary domain.

Using this strategy, the inputs to that function can be built up, following the requirements stated in the arguments description section:

- the characteristic and the user-supplied intermediate points:
  \[ \text{nlines, nus, coorch and coorus}; \]
- the characteristic lines:
  \[ \text{lined, fbdn, rate} \]
- finally the assembly of lines into the connected components of the boundary:
  \[ \text{ncomp, and} \]
  \[ \text{nlcomp, lcomp}. \]
The example below details the use of this strategy.

9 Example

The NAG logo is taken as an example of a geometry with holes. The boundary has been partitioned in 40 lines characteristic points; including 4 for the exterior boundary and 36 for the logo itself. All line geometry specifications have been considered, see the argument description of lined, including 4 lines defined as polygonal arc, 4 defined by a user-supplied function and all the others are straight lines.

Figure 1 top represents the boundary mesh of the NAG logo; there are 259 nodes and 259 edges. The Figure 1 middle and bottom represent the final mesh built using respectively the Delaunay-Voronoi (nag_mesh2d_delaunay (d06abc)) and the Advancing front (nag_mesh2d_front (d06acc)) method.

9.3 Program Results

d06bac Example Program Results

ANALYSIS OF THE BOUNDARY CREATED:
THE BOUNDARY MESH CONTAINS 259 VERTEX AND 259 EDGES
THERE ARE 4 COMPONENTS CONNECTED THE BOUNDARY
THE 1-st COMPONENT CONTAINS 4 LINES IN ANTICLOCKWISE ORIENTATION
THE 2-nd COMPONENT CONTAINS 10 LINES IN CLOCKWISE ORIENTATION
THE 3-rd COMPONENT CONTAINS 8 LINES IN CLOCKWISE ORIENTATION
THE 4-th COMPONENT CONTAINS 18 LINES IN CLOCKWISE ORIENTATION

Boundary mesh characteristics
nvb = 259
nedge = 259
Complete mesh characteristics (Delaunay-Voronoi)
nv = 652
nelt = 1049
Complete mesh characteristics (Advancing Front)

nv = 662
nelt = 1069
Figure 1
The boundary mesh (top), the Delaunay–Voronoi mesh (middle) and the Advancing Front mesh (bottom) of the NAG logo geometry
