1 Purpose

nag_complex_bessel_k (s18dcc) returns a sequence of values for the modified Bessel functions $K_{\nu+n}(z)$ for complex $z$, non-negative $\nu$ and $n = 0, 1, \ldots, N - 1$, with an option for exponential scaling.

2 Specification

void nag_complex_bessel_k (double fnu, Complex z, Integer n, Nag_ScaleResType scal, Complex cy[], Integer *nz, NagError *fail)

3 Description

nag_complex_bessel_k (s18dcc) evaluates a sequence of values for the modified Bessel function $K_{\nu}(z)$, where $z$ is complex, $-\pi < \arg z \leq \pi$, and $\nu$ is the real, non-negative order. The $N$-member sequence is generated for orders $\nu, \nu + 1, \ldots, \nu + N - 1$. Optionally, the sequence is scaled by the factor $e^{\nu}$.

The function is derived from the routine CBESK in Amos (1986).

Note: although the function may not be called with $\nu$ less than zero, for negative orders the formula $K_{-\nu}(z) = K_{\nu}(z)$ may be used.

When $N$ is greater than 1, extra values of $K_{\nu}(z)$ are computed using recurrence relations.

For very large $|z|$ or $(\nu + N - 1)$, argument reduction will cause total loss of accuracy, and so no computation is performed. For slightly smaller $|z|$ or $(\nu + N - 1)$, the computation is performed but results are accurate to less than half of machine precision. If $|z|$ is very small, near the machine underflow threshold, or $(\nu + N - 1)$ is too large, there is a risk of overflow and so no computation is performed. In all the above cases, a warning is given by the function.

4 References

5 Parameters

1: fnu – double

On entry: the order, $\nu$, of the first member of the sequence of functions.

Constraint: fnu $\geq 0.0$.

2: z – Complex

On entry: the argument $z$ of the functions.

Constraint: $z \neq (0.0, 0.0)$.

3: n – Integer

On entry: the number, $N$, of members required in the sequence $K_{\nu}(z), K_{\nu+1}(z), \ldots, K_{\nu+N-1}(z)$.

Constraint: $n \geq 1$. 

[NP3645/7] s18dcc.1
4: \texttt{scal} – Nag_ScaleResType  
*Input*

\textit{On entry:} the scaling option.

If \texttt{scal} = Nag_UnscaleRes, the results are returned unscaled.

If \texttt{scal} = Nag_ScaleRes, the results are returned scaled by the factor $e^z$.

\textit{Constraint:} \texttt{scal} = Nag_UnscaleRes or Nag_ScaleRes.

5: \texttt{cy[n]} – Complex  
*Output*

\textit{On exit:} the $N$ required function values: $\texttt{cy}[i - 1]$ contains $K_{\nu+i-1}(z)$, for $i = 1, 2, \ldots, N$.

6: \texttt{nz} – Integer *  
*Output*

\textit{On exit:} the number of components of \texttt{cy} that are set to zero due to underflow. If \texttt{nz} > 0 and $\text{Re}\ z \geq 0.0$, elements $\texttt{cy}[0], \texttt{cy}[1], \ldots, \texttt{cy}[\texttt{nz} - 1]$ are set to zero. If $\text{Re}\ z < 0.0$, \texttt{nz} simply states the number of underflows, and not which elements they are.

7: \texttt{fail} – NagError *  
*Input/Output*

The NAG error parameter (see the Essential Introduction).

6 \ Error Indicators and Warnings

\textbf{NE_INT}  
On entry, \texttt{n} = \langle\text{value}\rangle.

\textit{Constraint:} \texttt{n} \geq 1.

\textbf{NE_COMPLEX_ZERO}  
On entry, \texttt{z} = (0.0, 0.0).

\textbf{NE_OVERFLOW_LIKELY}  
No computation because $\text{abs}(z) = \langle\text{value}\rangle < \langle\text{value}\rangle$.

No computation because $\texttt{fnu} + n - 1 = \langle\text{value}\rangle$ is too large.

\textbf{NE_REAL}  
On entry, \texttt{fnu} = \langle\text{value}\rangle.

\textit{Constraint:} \texttt{fnu} \geq 0.

\textbf{NE_TERMINATION_FAILURE}  
No computation – algorithm termination condition not met.

\textbf{NE_TOTAL_PRECISION_LOSS}  
No computation because $\text{abs}(z) = \langle\text{value}\rangle > \langle\text{value}\rangle$.

\textbf{NW_SOME_PRECISION_LOSS}  
Results lack precision because $\texttt{fnu} + n - 1 = \langle\text{value}\rangle > \langle\text{value}\rangle$.

Results lack precision because $\text{abs}(z) = \langle\text{value}\rangle > \langle\text{value}\rangle$.

\textbf{NE_BAD_PARAM}  
On entry, parameter \langle\text{value}\rangle had an illegal value.
NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

7 Accuracy

All constants in nag_complex_bessel_k (s18dcc) are given to approximately 18 digits of precision. Calling the number of digits of precision in the floating-point arithmetic being used \( t \), then clearly the maximum number of correct digits in the results obtained is limited by \( p = \min(t, 18) \). Because of errors in argument reduction when computing elementary functions inside nag_complex_bessel_k (s18dcc), the actual number of correct digits is limited, in general, by \( p = s + t \), where \( s \approx \max(1, |\log_{10} |z|, |\log_{10} \nu|) \) represents the number of digits lost due to the argument reduction. Thus the larger the values of \(|z|\) and \( \nu \), the less the precision in the result. If nag_complex_bessel_k (s18dcc) is called with \( n > 1 \), then computation of function values via recurrence may lead to some further small loss of accuracy.

If function values which should nominally be identical are computed by calls to nag_complex_bessel_k (s18dcc) with different base values of \( \nu \) and different \( n \), the computed values may not agree exactly. Empirical tests with modest values of \( \nu \) and \( z \) have shown that the discrepancy is limited to the least significant 3 – 4 digits of precision.

8 Further Comments

The time taken by the function for a call of nag_complex_bessel_k (s18dcc) is approximately proportional to the value of \( n \), plus a constant. In general it is much cheaper to call nag_complex_bessel_k (s18dcc) with \( n \) greater than 1, rather than to make \( N \) separate calls to nag_complex_bessel_k (s18dcc).

Paradoxically, for some values of \( z \) and \( \nu \), it is cheaper to call nag_complex_bessel_k (s18dcc) with a larger value of \( n \) than is required, and then discard the extra function values returned. However, it is not possible to state the precise circumstances in which this is likely to occur. It is due to the fact that the base value used to start recurrence may be calculated in different regions for different \( n \), and the costs in each region may differ greatly.

Note that if the function required is \( K_0(x) \) or \( K_1(x) \), i.e., \( \nu = 0.0 \) or 1.0, where \( x \) is real and positive, and only a single function value is required, then it may be much cheaper to call nag_bessel_k0 (s18acc), nag_bessel_k1 (s18adc), nag_bessel_k0_scaled (s18ccc) or nag_bessel_k1_scaled (s18cdc), depending on whether a scaled result is required or not.

9 Example

The example program prints a caption and then proceeds to read sets of data from the input data stream. The first datum is a value for the order \( \text{fnu} \), the second is a complex value for the argument, \( z \), and the third is a character value used as a flag to set the parameter \( \text{scal} \). The program calls the function with \( n = 2 \) to evaluate the function for orders \( \text{fnu} \) and \( \text{fnu} + 1 \), and it prints the results. The process is repeated until the end of the input data stream is encountered.
