NAG C Library Function Document

**nag_jacobian_theta (s21ccc)**

1 Purpose

*nag_jacobian_theta (s21ccc)* returns the value of one of the Jacobian theta functions \( \theta_0(x, q), \theta_1(x, q), \theta_2(x, q), \theta_3(x, q) \) or \( \theta_4(x, q) \) for a real argument \( x \) and non-negative \( q \leq 1 \).

2 Specification

double nag_jacobian_theta (Integer k, double x, double q, NagError *fail)

3 Description

This routine evaluates an approximation to the Jacobian theta functions \( \theta_0(x, q), \theta_1(x, q), \theta_2(x, q), \theta_3(x, q) \) and \( \theta_4(x, q) \) given by

\[
\begin{align*}
\theta_0(x, q) &= 1 + 2 \sum_{n=1}^{\infty} (-1)^n q^n \cos(2n\pi x), \\
\theta_1(x, q) &= 2 \sum_{n=0}^{\infty} (-1)^n q^{(n+\frac{1}{2})^2} \sin\{(2n+1)\pi x\},
\end{align*}
\]

\[
\begin{align*}
\theta_2(x, q) &= 2 \sum_{n=0}^{\infty} q^{(n+\frac{1}{2})^2} \cos\{(2n+1)\pi x\}, \\
\theta_3(x, q) &= 1 + 2 \sum_{n=1}^{\infty} q^n \cos(2n\pi x), \\
\theta_4(x, q) &= \theta_0(x, q),
\end{align*}
\]

where \( x \) and \( q \) (the nome) are real with \( 0 \leq q \leq 1 \). Note that \( \theta_1(x - \frac{1}{2}, 1) \) is undefined if \( (x - \frac{1}{2}) \) is an integer, as is \( \theta_2(x, 1) \) if \( x \) is an integer; otherwise, \( \theta_i(x, 1) = 0, \) for \( i = 0, 1, \ldots, 4. \)

These functions are important in practice because every one of the Jacobian elliptic functions (see nag_jacobian_elliptic (s21bc)) can be expressed as the ratio of two Jacobian theta functions (see Whittaker and Watson (1990)). There is also a bewildering variety of notations used in the literature to define them. Some authors (e.g., Abramowitz and Stegun (1972), 16.27) define the argument in the trigonometric terms to be \( \pi x \) instead of \( x \). This can often lead to confusion, so great care must therefore be exercised when consulting the literature. Further details (including various relations and identities) can be found in the references.

*nag_jacobian_theta (s21ccc)* is based on a truncated series approach. If \( t \) differs from \( x \) or \( -x \) by an integer when \( 0 \leq t \leq \frac{1}{2} \), it follows from the periodicity and symmetry properties of the functions that \( \theta_1(x, q) = \pm \theta_1(t, q) \) and \( \theta_3(x, q) = \pm \theta_3(t, q) \). In a region for which the approximation is sufficiently accurate, \( \theta_1 \) is set equal to the first term (\( n = 0 \)) of the transformed series

\[
\theta_1(t, q) = 2 \sqrt{\frac{\lambda}{\pi}} e^{-\lambda t^2} \sum_{n=0}^{\infty} (-1)^n e^{-(\lambda(n+\frac{1}{2})^2)} \sinh\{(2n+1)\lambda t\}
\]

and \( \theta_3 \) is set equal to the first two terms (i.e., \( n \leq 1 \)) of

\[
\theta_3(t, q) = \sqrt{\frac{\lambda}{\pi}} e^{-\lambda t^2} \left\{ 1 + 2 \sum_{n=1}^{\infty} e^{-\lambda n^2} \cosh(2n\lambda t) \right\},
\]

where \( \lambda = \pi^2/|\log_q| \). Otherwise, the trigonometric series for \( \theta_1(t, q) \) and \( \theta_3(t, q) \) are used. For all values of \( x \), \( \theta_0 \) and \( \theta_2 \) are computed from the relations \( \theta_0(x, q) = \theta_3(\frac{1}{2} - |x|, q) \) and \( \theta_2(x, q) = \theta_1(\frac{1}{2} - |x|, q) \).
4 Parameters

1: \( k \) – Integer

*Input*

On entry: the function \( \theta_k(x, q) \) to be evaluated. Note that \( k = 4 \) is equivalent to \( k = 0 \).

Constraint: \( 0 \leq k \leq 4 \).

2: \( x \) – double

*Input*

On entry: the argument \( x \) of the function.

Constraints:

- \( x \) must not be an integer when \( q = 1.0 \) and \( k = 2 \),
- \( (x - 0.5) \) must not be an integer when \( q = 1.0 \) and \( k = 1 \).

3: \( q \) – double

*Input*

On entry: the argument \( q \) of the function.

Constraint: \( 0.0 \leq q \leq 1.0 \).

4: \( \text{fail} \) – NagError *

*Input/Output*

The NAG error parameter (see the Essential Introduction).

5 Error Indicators and Warnings

**NE_INT**

On entry, \( k = \text{<value>} \).

Constraint: \( 0 \leq k \leq 4 \).

**NE_REAL**

On entry, \( q = \text{<value>} \).

Constraint: \( 0.0 \leq q \leq 1.0 \).

On entry, \( x = \text{<value>} \).

Constraint: \( (x - 0.5) \) must not be an integer when \( q = 1.0 \) and \( k = 1 \).

On entry, \( x = \text{<value>} \).

Constraint: \( x \) must not be an integer when \( q = 1.0 \) and \( k = 2 \).

**NE_INFINITE**

The evaluation has been abandoned because the function value is infinite.

**NE_INTERNAL_ERROR**

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.

6 Further Comments

6.1 Accuracy

In principle the routine is capable of achieving full relative precision in the computed values. However, the accuracy obtainable in practice depends on the accuracy of the C standard library elementary functions such as sin and cos.

None.

8 Example

The example program evaluates $\theta_2(x, q)$ at $x = 0.7$ when $q = 0.4$, and prints the results.
