NAG C Library Function Document

nag_pack_complx_mat_print_comp (x04ddc)

1 Purpose

nag_pack_complx_mat_print_comp (x04ddc) prints a complex triangular matrix stored in a packed one-dimensional array.

2 Specification

```c
void nag_pack_complx_mat_print_comp (Nag_OrderType order, Nag_UploType uplo, Nag_DiagType diag, Integer n, const Complex a[], Nag_ComplexFormType cmplxform, const char *format, const char *title, Nag_LabelType labrow, const char *rlabs[], Nag_LabelType labcol, const char *clabs[], Integer ncols, Integer indent, const char *outfile, NagError *fail)
```

3 Description

nag_pack_complx_mat_print_comp (x04ddc) prints a complex triangular matrix stored in packed form, using a format specifier supplied by the user. The matrix is output to the file specified by `outfile` or, by default, to standard output.

4 References

None.

5 Parameters

1. **order** – Nag_OrderType  
   
   *Input*
   
   *On entry*: the `order` parameter specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by `order = Nag_RowMajor`. See Section 2.2.1.4 of the Essential Introduction for a more detailed explanation of the use of this parameter.
   
   *Constraint*: `order = Nag_RowMajor` or `Nag_ColMajor`.

2. **uplo** – Nag_UploType  
   
   *Input*
   
   *On entry*: indicates the type of the matrix to be printed, as follows:
   
   - if `uplo = Nag_Lower`, the matrix is lower triangular;
   - if `uplo = Nag_Upper`, the matrix is upper triangular.
   
   *Constraint*: `uplo = Nag_Lower` or `Nag_Upper`.

3. **diag** – Nag_DiagType  
   
   *Input*
   
   *On entry*: indicates whether the diagonal elements of the matrix are to be printed, as follows:
   
   - if `diag = Nag_NonRefDiag`, the diagonal elements of the matrix are not referenced and not printed;
   - if `diag = Nag_UnitDiag`, the diagonal elements of the matrix are not referenced, but are assumed all to be unity, and are printed as such;
   - if `diag = Nag_NonUnitDiag`, the diagonal elements of the matrix are referenced and printed.
   
   *Constraint*: `diag = Nag_NonRefDiag`, `Nag_UnitDiag` or `Nag_NonUnitDiag`. 

[NP3645/7]
4: n – Integer

*Input*

On entry: the number of rows and columns of the matrix to be printed.

If n is less than 1, nag_pack_complex_mat_print_comp (x04ddc) will exit immediately after printing

*title; no row or column labels are printed.*

5: a[ndim] – const Complex

*Input*

Note: the dimension, *ndim*, of the array a must be at least max(1,n × (n + 1)/2).

On entry: the matrix to be printed. The storage of elements ai,j depends on the *order* and *uplo* parameters as follows:

if *order* = Nag_ColMajor and *uplo* = Nag_Upper,

ai,j is stored in a[(j - 1) × j/2 + i - 1], for i ≤ j;

if *order* = Nag_ColMajor and *uplo* = Nag_Lower,

ai,j is stored in a[(2n - j) × (j - 1)/2 + i - 1], for i ≥ j;

if *order* = Nag_RowMajor and *uplo* = Nag_Upper,

ai,j is stored in a[(2n - i) × (i - 1)/2 + j - 1], for i ≤ j;

if *order* = Nag_RowMajor and *uplo* = Nag_Lower,

ai,j is stored in a[(i - 1) × i/2 + j - 1], for i ≥ j.

Note that a must have space for the diagonal elements of the matrix, even if these are not stored.

6: cmplxform – Nag_ComplexFormType

*Input*

On entry: indicates how the value of *format* is to be used to print matrix elements.

If cmplxform = Nag_AboveForm, the format code in *format* is assumed to contain a single real
edit-descriptor which is to be used to print the real and imaginary parts of each complex number one
above the other. Each row of the matrix is separated by a blank line, and any row labels are
attached only to the real parts. This option means that about twice as many columns can be fitted
into *ncols* characters than if any other cmplxform option is used. A typical value of *format* for this
cmplxform option might be %11.4e.

If cmplxform = Nag_BracketForm, the format code in *format* is assumed to contain a single real
edit-descriptor such as %13.4f, * or NULL, which is used to print the real and imaginary parts of each
complex number separated by a comma, and surrounded by brackets. Thus a matrix element printed
with this cmplxform option might look like this: (12.345, 11.323).

If cmplxform = Nag_DirectForm, the format code in *format* is used unaltered to print a complex
number. This cmplxform option allows the user flexibility to specify exactly how the number is
printed. With this option for cmplxform and a suitable value for *format* it is possible, for example,
to print a complex number in the form (0.123 + 3.214i) or (0.123e−02, 0.234e−01).

Constraint: cmplxform = Nag_AboveForm, Nag_BracketForm or Nag_DirectForm.

7: format – char

*Input*

On entry: a valid C format code. This should be of the form %[flag]ww.pp[format indicator],
where *ww,pp* indicates that up to 2 digits may be used to specify the field width and precision
respectively. Only % and format indicator must be present. flag can be one of –, +,
<space > or # and format indicator can be e, E, f, g or G. Thus, possible formats include %f,
%11.4G, %.6e. format is used in conjunction with parameter cmplxform, described above, to
print elements of the matrix A.

In addition, nag_pack_complex_mat_print_comp (x04ddc) chooses its own format code when format
is NULL or format = *.

If format = NULL, nag_pack_complex_mat_print_comp (x04ddc) will choose a format code such
that numbers will be printed with either a %8.4f, a %11.4f or a %13.4e format. The %8.4f code is
chosen if the sizes of all the matrix elements to be printed lie between 0.001 and 1.0. The %11.4f
code is chosen if the sizes of all the matrix elements to be printed lie between 0.001 and 9999.9999. Otherwise
the \%13.4e code is chosen.

If \texttt{format} = *, \texttt{nag_pack_complx_mat_print_comp (x04ddc)} will choose a format code such that
numbers will be printed to as many significant digits as are necessary to distinguish between
neighbouring machine numbers. Thus any two numbers that are stored with different internal
representations should look different on output.

More complicated values of \texttt{format}, to print a complex number in a desired form, may be used.
See the description of parameter \texttt{cmplxform} above for more details.

\textbf{Constraint:}

\begin{itemize}
\item if \texttt{cmplxform = Nag_AboveForm} or \texttt{Nag_BracketForm}, \texttt{format} must be of the form
\begin{verbatim}
\%[flag]ww.pp[format indicator].
\end{verbatim}
\end{itemize}

8: \texttt{title} -- char *

\textit{Input}

\textit{On entry:} a title to be printed above the matrix. If \texttt{title = NULL}, no title (and no blank line) will
be printed.

If \texttt{title} contains more than \texttt{ncols} characters, the contents of \texttt{title} will be wrapped onto more than one
line, with the break after \texttt{ncols} characters.

Any trailing blank characters in \texttt{title} are ignored.

9: \texttt{labrow} -- \texttt{Nag_LabelType}

\textit{Input}

\textit{On entry:} indicates the type of labelling to be applied to the rows of the matrix, as follows:

\begin{itemize}
\item if \texttt{labrow = Nag_NoLabels}, \texttt{nag_pack_complx_mat_print_comp (x04ddc)} prints no row
labels;
\item if \texttt{labrow = Nag_IntegerLabels}, \texttt{nag_pack_complx_mat_print_comp (x04ddc)} prints integer
row labels;
\item if \texttt{labrow = Nag_CharacterLabels}, \texttt{nag_pack_complx_mat_print_comp (x04ddc)} prints character
labels, which must be supplied in array \texttt{rlabs}.
\end{itemize}

\textbf{Constraint:} \texttt{labrow \in \{Nag_NoLabels, Nag_IntegerLabels, Nag_CharacterLabels\}}.

10: \texttt{rlabs[dim]} -- const char *

\textit{Input}

\textit{On entry:} if \texttt{labrow = Nag_CharacterLabels}, \texttt{rlabs} must be dimensioned at least of length \texttt{n}
and must contain labels for the rows of the matrix, otherwise \texttt{rlabs} should be \texttt{NULL}.

Labels are right justified when output, in a field which is as wide as necessary to hold the longest
row label. Note that this field width is subtracted from the number of usable columns, \texttt{ncols}.

11: \texttt{labcol} -- \texttt{Nag_LabelType}

\textit{Input}

\textit{On entry:} indicates the type of labelling to be applied to the columns of the matrix, as follows:

\begin{itemize}
\item if \texttt{labcol = Nag_NoLabels}, \texttt{nag_pack_complx_mat_print_comp (x04ddc)} prints no column
labels;
\item if \texttt{labcol = Nag_IntegerLabels}, \texttt{nag_pack_complx_mat_print_comp (x04ddc)} prints integer
column labels;
\item if \texttt{labcol = Nag_CharacterLabels}, \texttt{nag_pack_complx_mat_print_comp (x04ddc)} prints character
labels, which must be supplied in array \texttt{clabs}.
\end{itemize}

\textbf{Constraint:} \texttt{labcol \in \{Nag_NoLabels, Nag_IntegerLabels, Nag_CharacterLabels\}}.

12: \texttt{clabs[dim]} -- const char *

\textit{Input}

\textit{On entry:} if \texttt{labcol = Nag_CharacterLabels}, \texttt{clabs} must be dimensioned at least of length \texttt{n}
and must contain labels for the columns of the matrix, otherwise \texttt{clabs} should be \texttt{NULL}.
Labels are right-justified when output. Any label that is too long for the column width, which is determined by format, is truncated.

13: \textbf{ncols} – Integer \hspace{1cm} \textit{Input}

\textit{On entry:} the maximum output record length. If the number of columns of the matrix is too large to be accommodated in ncols characters, the matrix will be printed in parts, containing the largest possible number of matrix columns, and each part separated by a blank line.

ncols must be large enough to hold at least one column of the matrix using the format specifier in format. If a value less than or equal to 0 or greater than 132 is supplied for ncols, then the value 80 is used instead.

14: \textbf{indent} – Integer \hspace{1cm} \textit{Input}

\textit{On entry:} the number of columns by which the matrix (and any title and labels) should be indented. The effective value of ncols is reduced by indent columns. If a value less than 0 or greater than ncols is supplied for indent, the value 0 is used instead.

15: \textbf{outfile} – char * \hspace{1cm} \textit{Input}

\textit{On entry:} the name of a file to which output will be directed. If outfile is NULL the output will be directed to standard output.

16: \textbf{fail} – NagError * \hspace{1cm} \textit{Input/Output}

The NAG error parameter (see the Essential Introduction).

6 Error Indicators and Warnings

\textbf{NE_COL_WIDTH}

\textit{\langle value \rangle} is not wide enough to hold at least one matrix column. ncols = \langle value \rangle, indent = \langle value \rangle.

\textbf{NE_INVALID_FORMAT}

The string \langle value \rangle, has not been recognised as a valid format.

\textbf{NE_ALLOC_FAIL}

Memory allocation failed.

\textbf{NE_BAD_PARAM}

On entry, parameter \langle value \rangle had an illegal value.

\textbf{NE_NOT_WRITE_FILE}

Cannot open file \langle value \rangle for writing.

\textbf{NE_NOT_APPEND_FILE}

Cannot open file \langle value \rangle for appending.

\textbf{NE_NOT_CLOSE_FILE}

Cannot close file \langle value \rangle.

\textbf{NE_INTERNAL_ERROR}

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please consult NAG for assistance.
7 Accuracy
Not applicable.

8 Further Comments
None.

9 Example
See Section 9 of the document for nag_zpptrf (f07gzc).
